# Chapter 1

## gdsl

### 1.1 Introduction

This is the gds (Release 1.8) documentation.

### 1.2 About

The Generic Data Structures Library (GDSL) is a collection of routines for generic data structures manipulation. It is a portable and re-entrant library fully written from scratch in pure ANSI C. It is designed to offer for C programmers common data structures with powerful algorithms, and hidden implementation. Available structures are lists, queues, stacks, hash tables, binary trees, binary search trees, red-black trees, 2D arrays, permutations, heaps and interval heaps.

#### 1.2.1 Authors

Nicolas Darnis <ndarnis@free.fr>: all GDSL modules excepted the ones listed below.

Peter Kergedjiev <pkerpedjiev@gmail.com>: interval\_heap module.

#### 1.2.2 Project Manager

Nicolas Darnis <ndarnis@free.fr>.

#### 4.8.1 Typedef Documentation

##### 4.8.1.1 **typedef struct hash\_table\* gdsl\_hash\_t**

--------------	------------------------------------

###### Returns

The key associated to the VALUE.

Definition at line 63 of file gdsi\_hash.h.

#### 4.8.1.3 `typedef ulong(* gdsI_hash_func_t)(const char *KEY)`

##### Parameters

<code>KEY</code>	the key used to compute the hash code.
------------------	--

##### Returns

The hashed value computed from KEY.

Definition at line 71 of file gdsI\_hash.h.

### 4.8.2 Function Documentation

#### 4.8.2.1 `ulong gdsI_hash( const char *KEY )`

Computes a hash value from a NULL terminated character string.

This function computes a hash value from the NULL terminated KEY string.

##### Note

Complexity:  $O(|key|)$

##### Precondition

KEY must be NULL-terminated.

##### Parameters

<code>KEY</code>	The NULL terminated string to compute the key from
------------------	--

##### Returns

the hash code computed from KEY.

#### 4.8.2.2 `gdsI_hash_t gdsI_hash_alloc( const char *NAME, gdsI_alloc_func_t ALLOC_F, gdsI_free_func_t FREE_F, gdsI_key_func_t KEY_F, gdsI_hash_func_t HASH_F, ushort INITIAL_ENTRIES_NB )`

Create a new hashtable.

Allocate a new hashtable data structure which name is set to a copy of NAME. The new hashtable will contain initially INITIAL\_ENTRIES\_NB lists. This value could be (only) increased with `gdsI_hash_modify()` (p. 101) function. Until this function is called, then all H's lists entries have no size limit. The function pointers ALLOC\_F and FREE\_F

could be used to respectively, alloc and free elements in the hashtable. The KEY\_F function must provide a unique key associated to its argument. The HASH\_F function must compute a hash code from its argument. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing
- the default KEY\_F simply returns its argument
- the default HASH\_F is **gdsl\_hash()** (p. 92) above

#### Note

Complexity: O( 1 )

#### Precondition

nothing.

#### Parameters

<i>NAME</i>	The name of the new hashtable to create
<i>ALLOC_F</i>	Function to alloc element when inserting it in the hashtable
<i>FREE_F</i>	Function to free element when deleting it from the hashtable
<i>KEY_F</i>	Function to get the key from an element
<i>HASH_F</i>	Function used to compute the hash value.
<i>INITIAL_ENTRIES_NB</i>	Initial number of entries of the hashtable

#### Returns

the newly allocated hashtable in case of success.  
NULL in case of insufficient memory.

#### See also

**4.8.2.12 gdsi\_element\_t gdsi\_hash\_insert( gdsi\_hash\_t H, void \* VALUE )**

Insert an element into a hashtable (PUSH).

Allocate a new element E by calling H's ALLOC\_F function on VALUE. The key K of the new element E is computed using KEY\_F called on E. If the value of gdsi\_hash\_get\_lists\_max\_size(H) is not reached, or if it is equal to zero, then the insertion is simple. Otherwise, H is re-organized as follow:

- its actual gdsi\_hash\_get\_entries\_number(H) (say N) is modified as  $N * 2 + 1$
- its actual gdsi\_hash\_get\_lists\_max\_size(H) (say M) is modified as  $M * 2$  The element E is then inserted into H at the entry computed by HASH\_F( K ) modulo gdsi\_hash\_get\_entries\_number(H). ALLOC\_F, KEY\_F and HASH\_F are the function pointers passed to [gdsi\\_hash\\_alloc\(\)](#) (p. 92).

**Note**

Complexity: O( 1 ) if gdsi\_hash\_get\_lists\_max\_size(H) is not reached or if it is equal to zero

Complexity: O ( gdsi\_hash\_modify (H) ) if gdsi\_hash\_get\_lists\_max\_size(H) is reached, so H needs to grow

**Precondition**

H must be a valid gdsi\_hash\_t

**Parameters**

<i>H</i>	The hashtable to modify
<i>VALUE</i>	The value used to make the new element to insert into H

**Returns**

the inserted element E in case of success.  
NULL in case of insufficient memory.

[examples/main\\_hash.c](#).

**4.8.2.13 `gdsl_element_t gdsl_hash_remove( gdsl_hash_t H, const char * KEY )`**

Remove an element from a hashtable (POP).

Search into the hashtable H for the first element E equal to KEY. If E is found, it is removed from H and then returned.

**Note**

Complexity: O( M ), where M is the average size of H's lists

**Precondition**

H must be a valid gdsl\_hash\_t

**Parameters**

<i>H</i>	The hashtable to modify
<i>KEY</i>	The key used to find the element to remove

**Returns**

the first founded element equal to KEY in H in case is found.  
NULL in case no element equal to KEY is found in H.

Examples:

[examples/main\\_hash.c](#).

#### 4.8.2.14 `gdsl_hash_t gdsl_hash_delete( gdsl_hash_t H, const char * KEY )`

Delete an element from a hashtable.

Remove from he hashtable H the first founded element E equal to KEY. If E is found, it is removed from H and E is deallocated using H's FREE\_F function passed to [gdsl\\_hash\\_alloc\(\)](#) (p. 92), then H is returned.

Note

Complexity: O( M ), where M is the average size of H's lists

Precondition

H must be a valid `gdsl_hash_t`

Parameters

<code>H</code>	The hashtable to modify
<code>KEY</code>	The key used to find the element to remove

Returns

the modified hashtable after removal of E if E was found.  
NULL if no element equal to KEY was found.

See also

#### 4.8.2.15 `gdsl_hash_t gdsl_hash_modify( gdsl_hash_t H, ushort NEW_ENTRIES_NB, ushort NEW_LISTS_MAX_SIZE )`

Increase the dimensions of a hashtable.

The hashtable H is re-organized to have NEW\_ENTRIES\_NB lists entries. Each entry is limited to NEW\_LISTS\_MAX\_SIZE elements. After a call to this function, all insertions into H will make H automatically growing if needed. The grow is needed each time an insertion makes an entry list to reach NEW\_LISTS\_MAX\_SIZE elements. In this case, H will be reorganized automatically by [gdsl\\_hash\\_insert\(\)](#) (p. 99).

#### Note

Complexity:  $O(|H|)$

#### Precondition

H must be a valid gdsl\_hash\_t & NEW\_ENTRIES\_NB > gdsl\_hash\_get\_entries\_number(H) & NEW\_LISTS\_MAX\_SIZE > gdsl\_hash\_get\_lists\_max\_size(H)

#### Parameters

<i>H</i>	The hashtable to modify
<i>NEW_ENTRIES_NB</i>	
<i>NEW_LISTS_MAX_SIZE</i>	

#### Returns

the modified hashtable H in case of success  
 NULL in case of failure, or in case NEW\_ENTRIES\_NB <= gdsl\_hash\_get\_entries\_number(H) or in case NEW\_LISTS\_MAX\_SIZE <= gdsl\_hash\_get\_lists\_max\_size(H) in these cases, H is not modified

#### 4.11.2.1 `gdsl_list_t gdsl_list_alloc( const char * NAME, gdsl_alloc_func_t ALLOC_F, gdsl_free_func_t FREE_F )`

Create a new list.

Allocate a new list data structure which name is set to a copy of NAME. The function pointers ALLOC\_F and FREE\_F could be used to respectively, alloc and free elements in the list. These pointers could be set to NULL to use the default ones:

- the default ALLOC\_F simply returns its argument
- the default FREE\_F does nothing

<code>NAME</code>	The name of the new list to create
<code>ALLOC_F</code>	Function to alloc element when inserting it in the list
<code>FREE_F</code>	Function to free element when removing it from the list

**Returns**

**4.18.1.2 `typedef gdsi_element_t(* gdsi_alloc_func_t)(void *USER_DATA)`**

GDSL Alloc element function type.

This function type is for allocating a new `gdsi_element_t` variable. The `USER_DATA` argument should be used to fill-in the new element.

**Parameters**

<code>USER_DATA</code>	user data used to create the new element.

**4.18.1.3 `typedef void(* gdsi_free_func_t)(gdsi_element_t E)`**

GDSL Free element function type.

This function type is for freeing a `gdsi_element_t` variable. The element must have been previously allocated by a function of `gdsi_alloc_func_t` type. A free function according to `gdsi_free_func_t` must free the resources allocated by the corresponding call to the function of type `gdsi_alloc_func_t`. The GDSL functions doesn't check if `E != NULL` before calling this function.

**Parameters**

<code>E</code>	The element to deallocate.
----------------	----------------------------

**See also**

`gdsi_alloc_func_t` (p. 235)
